# Listen twice. Write once. Or refuse.

A wrong pour entry is money paid for milk that was never poured. PaalKural turns a spoken Tamil or Tanglish pour into **one confirmed ledger entry** for a milk society: two independent listens check the member, litres, fat and shift, and a disagreement blocks the write until the operator decides.

THE PROBLEM

## A transcript is not an entry.

- **The line is loud.** Fans, cans, people — the operator is writing down money by ear.
- **Speech-to-text returns words,** not numbers that have been checked against a roster and a range.
- **A confident wrong number** becomes a wrong payment, and nobody notices until the books are reconciled.

THE SOLUTION · HOW ONE POUR MOVES

01
### Listen twice
The same clip is decoded raw, then again after a band-limit and spectral gate. In this build both listens are live **Gnani Prisma**.

02
### Compile four facts
A deterministic compiler turns each transcript into **member · litres · fat · shift**, then checks the roster and valid ranges.

03
### Gate the write
Both agree → pre-fill. One validates → pre-fill. Both valid but different → **CHECK blocks the log**. Neither → re-ask in Tamil.

04
### Read back, confirm
The operator hears the entry in Tamil and confirms. The receipt stores transcript, correction, provider and **audit hash**; the day book exports to CSV.

THE MOMENT THAT MATTERS · DEMO CLIP B05 AT 15 DB

## When the listens disagree, it refuses to choose.

| LISTEN 1 · RAW | LISTEN 2 · CONDITIONED | | LEDGER WRITE |
|---|---|---|---|
| 4.7 % FAT | 4.0 % FAT | CHECK | BLOCKED UNTIL RESOLVED |
| ✓ PASSED VALIDATION | ✓ PASSED VALIDATION | | |

Both answers are plausible. A transcript-only app has to pick one. PaalKural makes the disagreement **the operator's decision**: keep 4.7, save, and the entry lands as a receipt — ₹107.00, fully traceable.

Receipt E-0907AE
Audit hash 5a9ea86add4a

WHY IT WINS

- **It refuses to guess.** A split listen stops the write. A bad turn costs a re-ask, not a wrong payout.
- **It ships the evidence — including the bad news.** On our own 24-clip benchmark the filter alone did not beat raw. We published that negative result and built the gate that does.
- **It is a complete product, not a filter demo.** Operator console, ledger, receipts, CSV day book, Evidence Lab, live replay and 26 automated tests.
- **It speaks the line's language.** Tamil/Tanglish code-mix in, Tamil readback out, typed fallback when the line is too loud — all in a browser.

THE EVIDENCE · 24 SYNTHETIC TAMIL/TANGLISH CLIPS, 4 NOISE CONDITIONS, OUR BENCHMARK

| 24 | 192+192 | 0 | 26 |
|---|---|---|---|
| clips × 4 conditions (clean, 15, 5, 0 dB) × 2 listens | frozen local runs and live Prisma calls; 0 live API errors | silent errors in every condition — live Prisma gate | tests: parser variants, ranges, all gate outcomes, export |

The gate pre-filled **22/24** clean and **12/24** at 5 dB with **0 silent errors** in the frozen local book; the live book pre-filled **20/24** clean with 0 silent errors at every level. The books stay separate: the frozen benchmark is local faster-whisper, never a Gnani result.

WHY IT MATTERS

FOR THE OPERATOR
A disagreement becomes **a question, not a wrong payment** — and confirmation is by ear, in Tamil.

FOR THE SOCIETY
Every rupee in the day book carries **a transcript, a receipt and an audit hash**.

FOR TRUST
When a member disputes a pour, the line can show **what was heard and what was decided** — no one has to take a number on faith.
